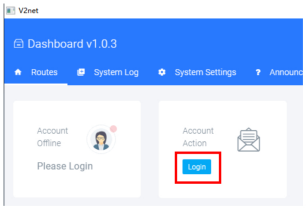
Set Up V2net on Windows

Click here to download the V2net client . After downloading, extract the archive and run the V2net installer.

If the application does not respond after installation, please update your system's Microsoft .NET Framework to version 4.8 or later.

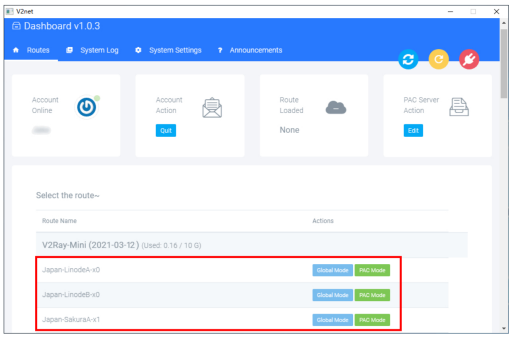
Launch the client and log in using the account you registered on our website.



Next, select a server node and click either **Global Mode** or **PAC Mode** to begin using the service.

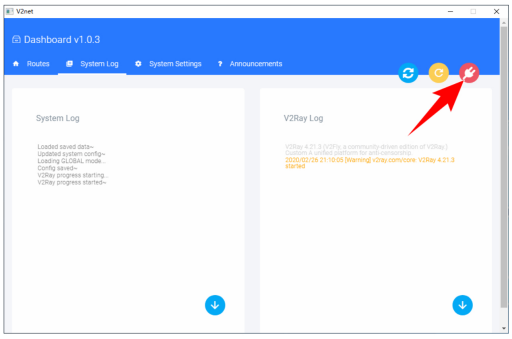
- **Global Mode**: Routes all internet traffic through the proxy.
- **PAC Mode**: Only forwards traffic that matches the default rule set through the proxy.

If you encounter an error message such as **"v2ray.exe has stopped working"**, please install the KB3063858 system update to fix the issue. If that update fails to install, try the alternative KB4457144 update .



When you're done using the client, click the red button in the upper-right corner to disconnect.

(The two buttons next to it are for **refreshing account data** and **refreshing PAC rules**, respectively.)



Enable Auto-Start on Boot (Optional)

To set V2net to start automatically when your computer boots:

- Press **Win + R** to open the Run dialog.
- Type `shell:startup` and click **OK**.
- In the Startup folder that opens, drag the V2net shortcut into the folder. This completes the auto-start configuration.
